

St. George's Field Site Analysis

History

Previously a cemetery with over 97,000 people buried between 1835 and 1969, the site includes a chapel opened in 1835 to create a more respectful and sanitary burial place. As the University of Leeds expanded around it, St. George's Field became overlooked. A parliamentary act later allowed the University to discontinue interments and transform the area into a green space open to the public.

Access Points

- 1) South Entrance
- 2) West Entrances
- 3) North-West Entrance
- 4) North-Central Entrance
- (not shown) East Entrance

Main Entrances:

- 1) The South Entrance sits near to the University Union. (Students often use this)
- 2) The West Entrance Provides direct access to the Medical and Biological Engineering facility entrance.
- 3) Nearest to the General Engineering Building's entrance

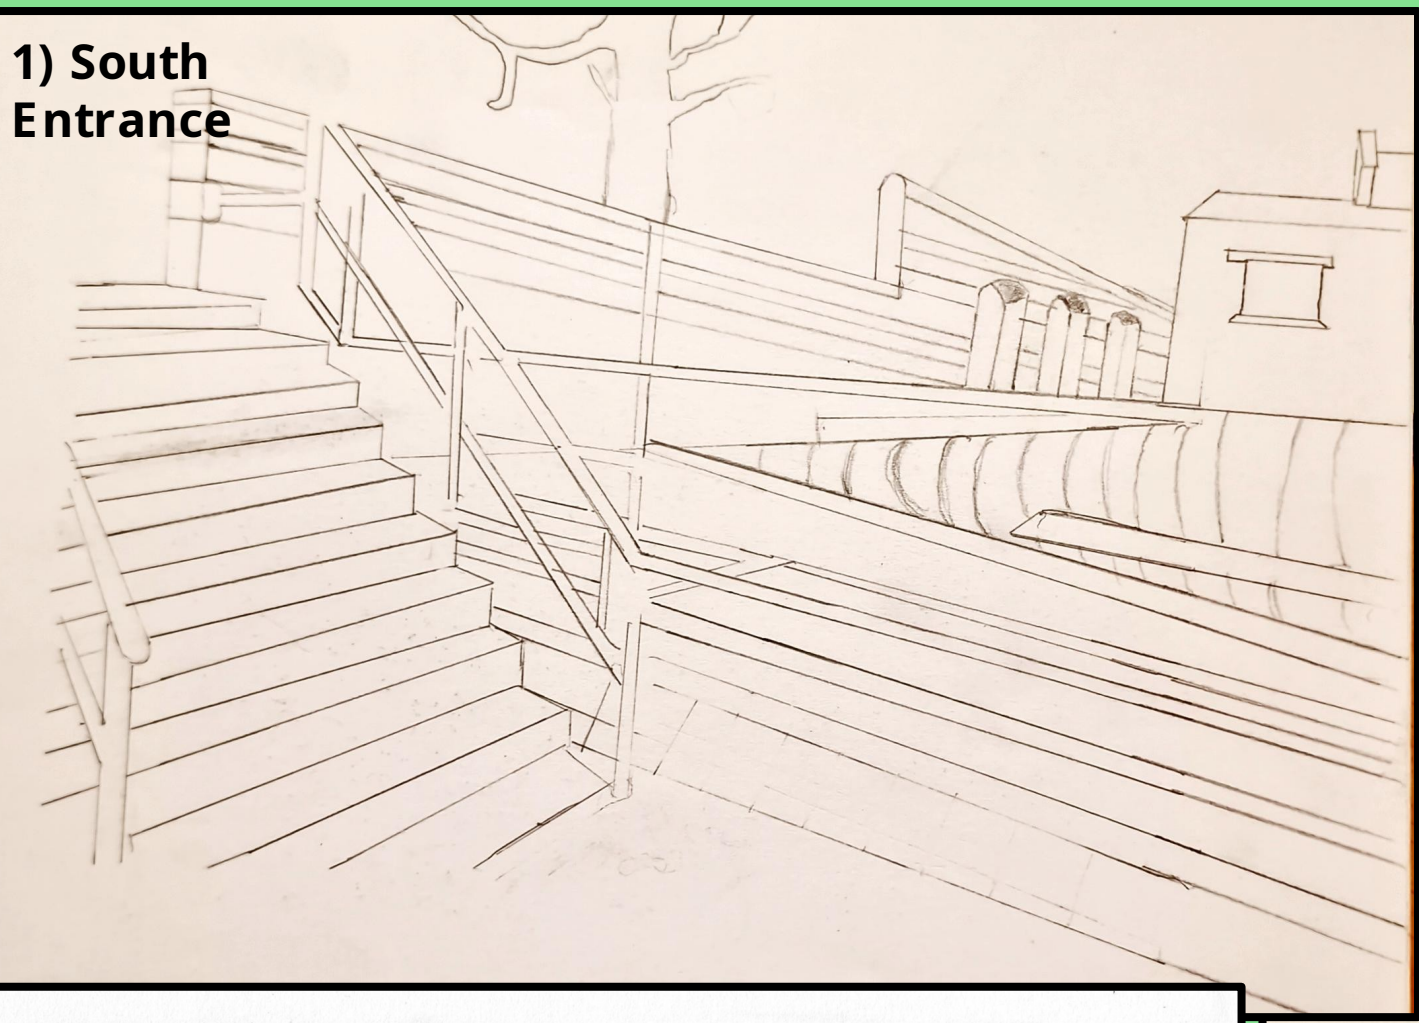

Secondary Entrances:

- 4) The North-Central Entrance Connected to the Henry Price Residence. (used mainly by accommodation residents)
- (not shown) East Entrance: The most direct access point to Woodhouse Lane is the East Entrance (no official path connecting this entrance to the other walkways).

Purpose and User Experience:

These access points allow for St. Georges Field to be a scenic shortcut through campus rather than having to walk along

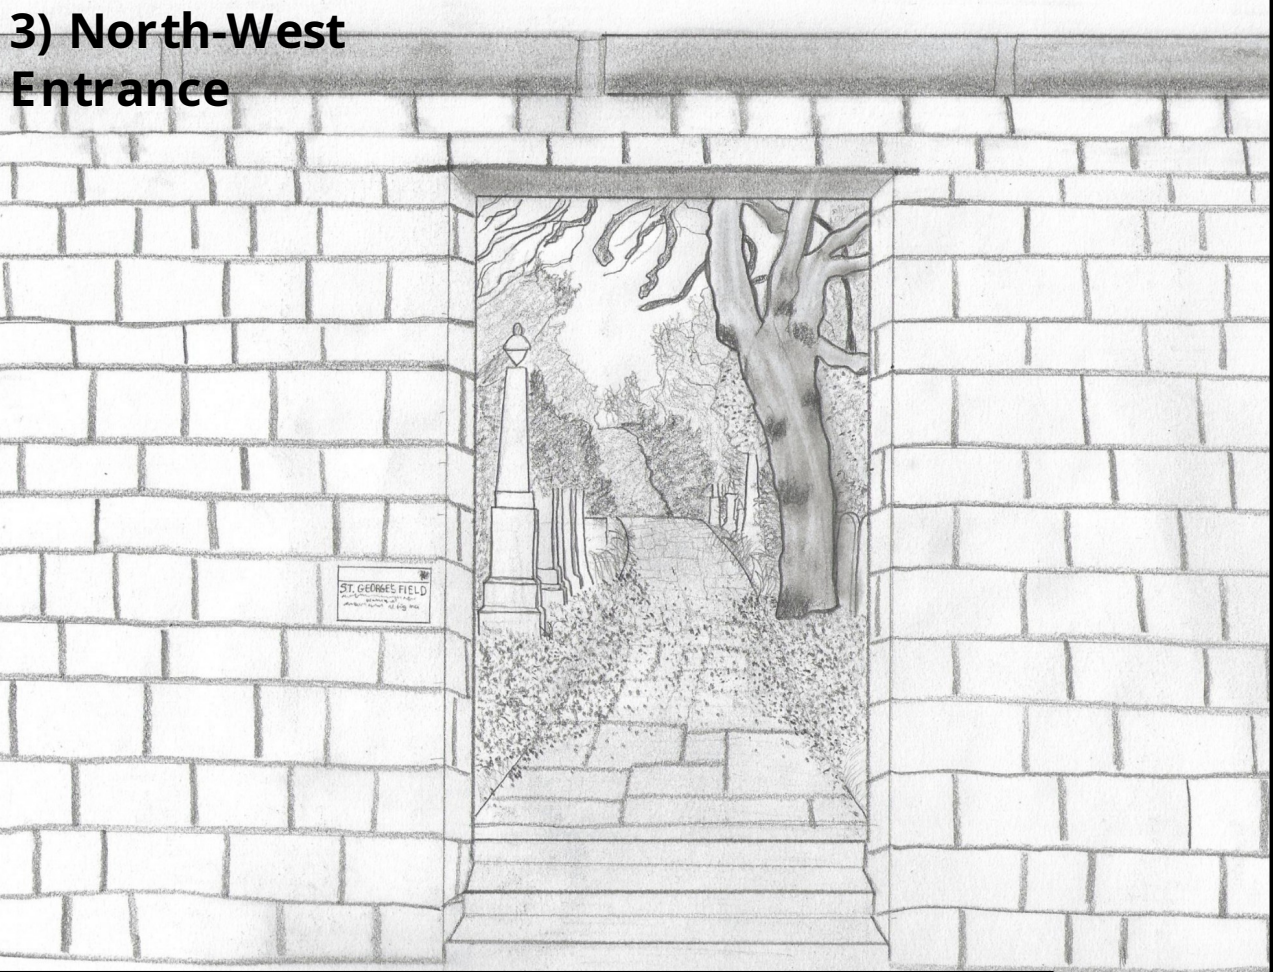

1) South Entrance

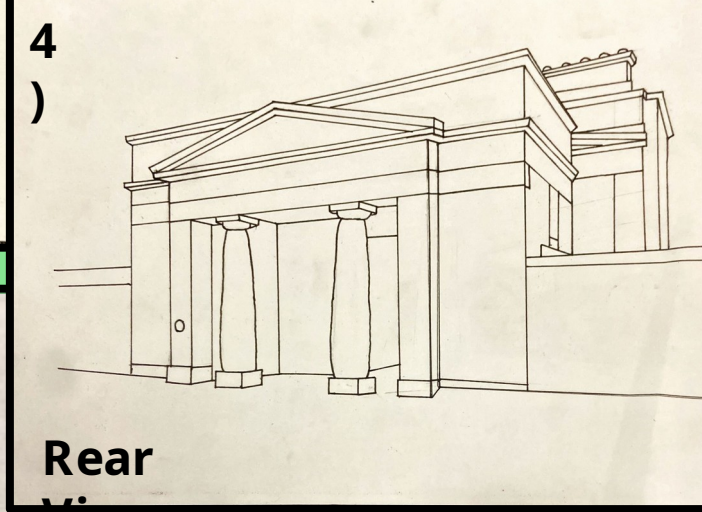

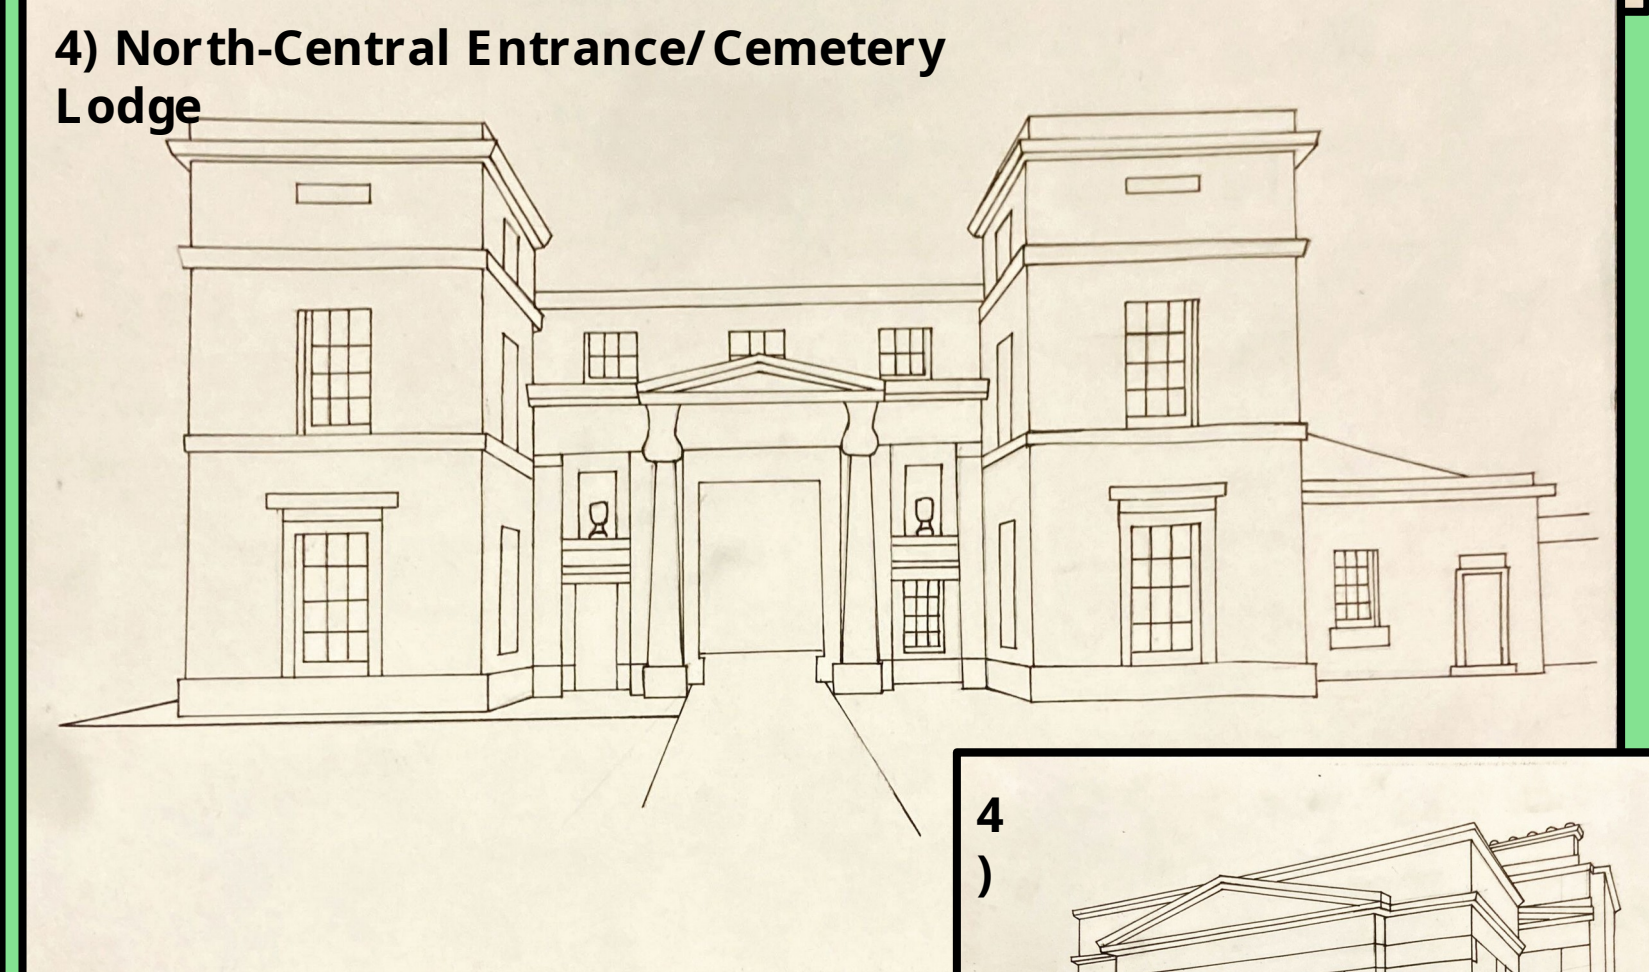

2) West Entrance

3) North-West Entrance

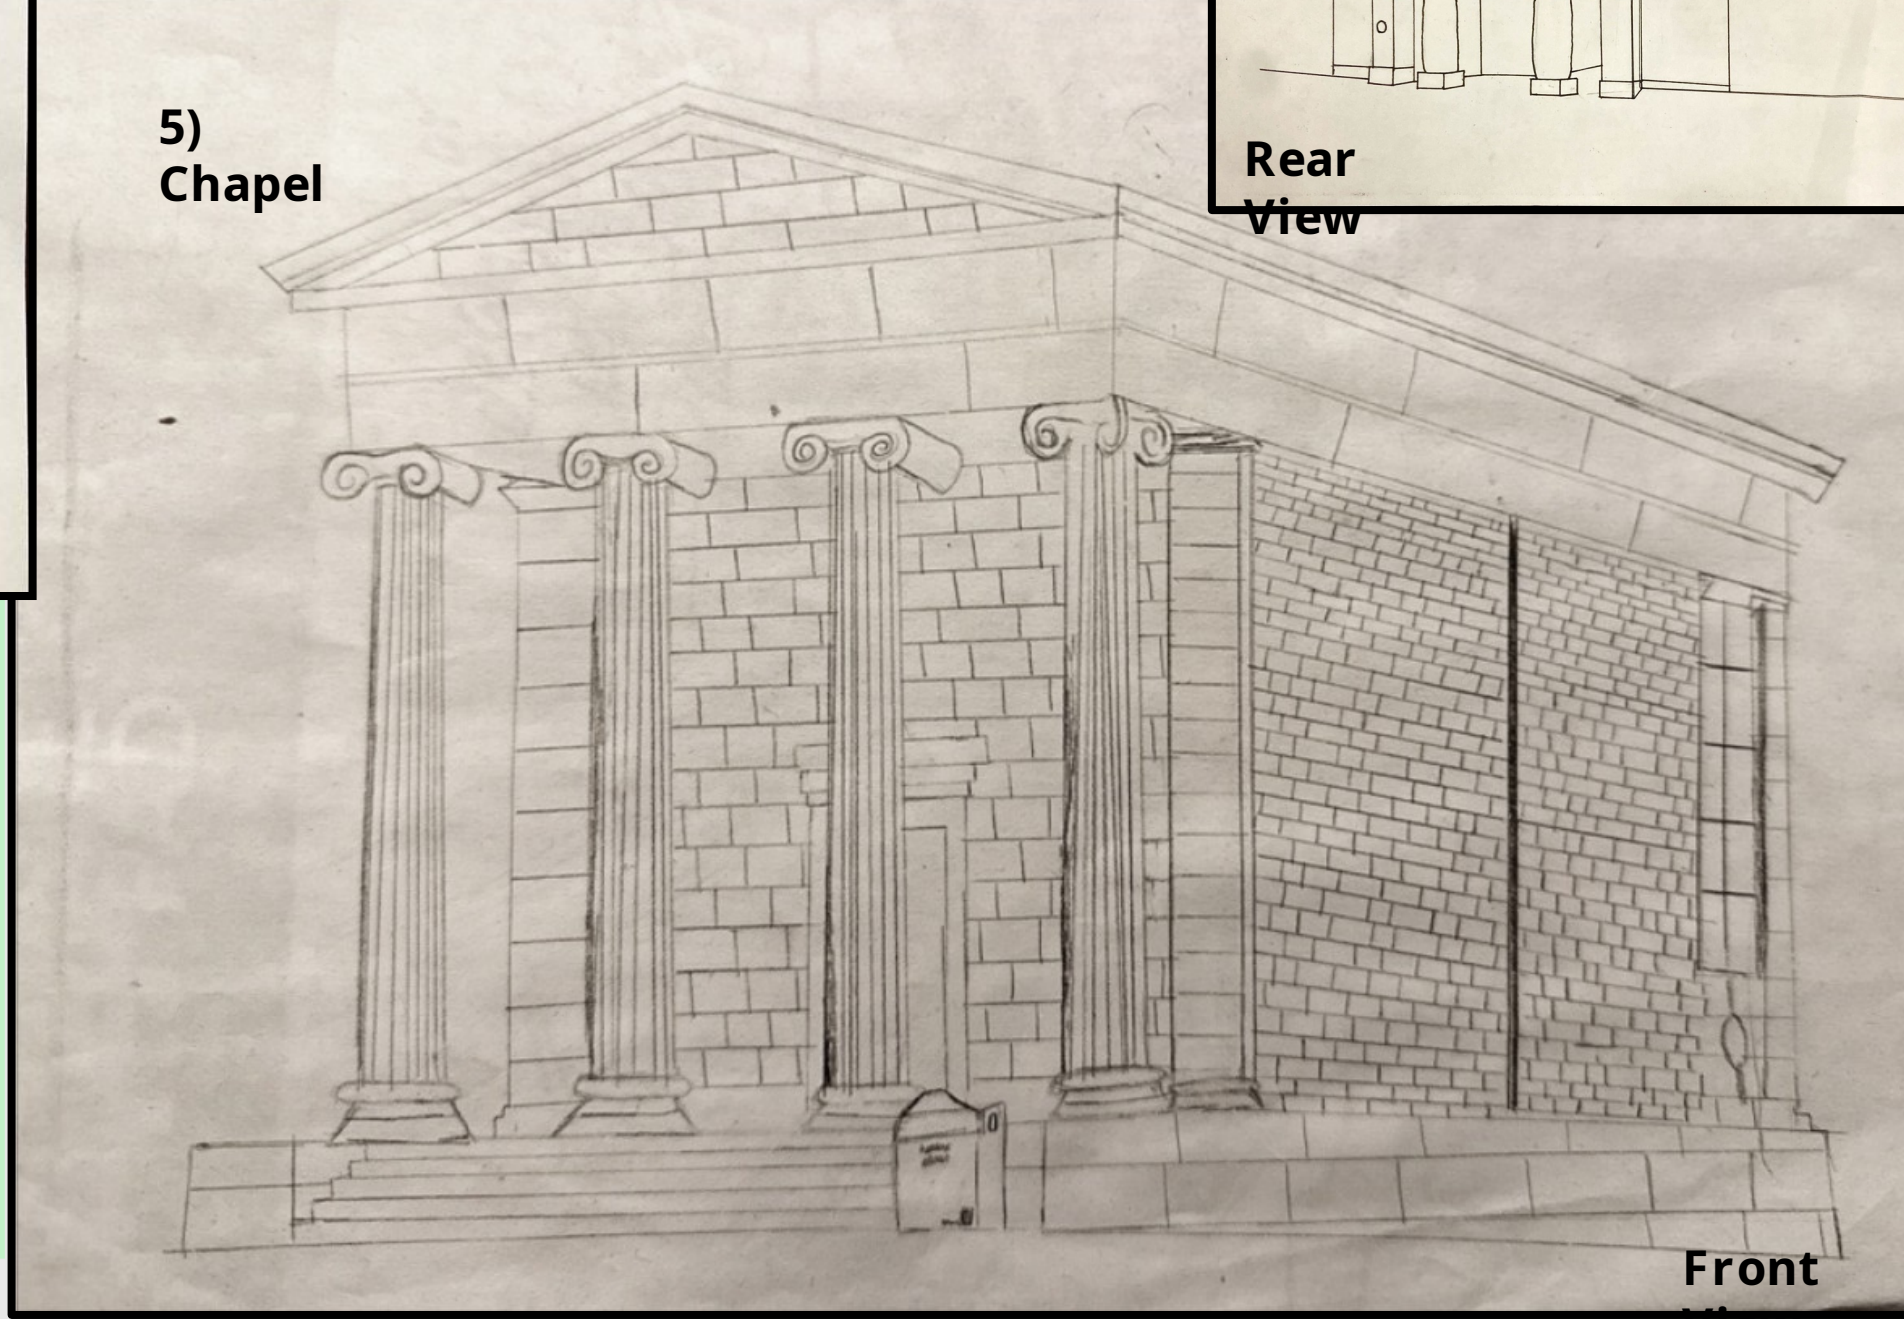

4) North-Central Entrance/ Cemetery Lodge

Fauna and Flora

Fauna: St George's Field supports a variety of small fauna, including resident mammals such as rabbits, squirrels, and bank voles. The field is also host to a significant population of birds and a diverse community of insects, contributing to the site's ecological balance.

Flora: The site features an established canopy of approximately 250 trees, comprising 15 distinct species. The composition is predominantly deciduous (13 species), reflecting a typical temperate environment. Only two species are evergreen: the Magnolia and the Western Red Cedar. The widespread success of these trees indicates their preference for and adaptation to the site's loamy soil conditions.

Site Description

Location: St George's Field is located amidst the University of Leeds's North campus, adjacent to Clarendon road on the west, in the Woodhouse area of Leeds. It is surrounded by multiple University buildings.

Geology: The surface is predominately grassy and well-maintained, with patches of compact soil and gravel paths. Some areas contains remnants of the original cemetery layout, including raised platforms and stonework, adding to the varied topography.

Topography: The field slopes gently from its highest point in the northwest of the field down to the southeast, near the clothworkers' building. This subtle but consistent gradient aids natural drainage, however, water still tends to accumulate in the centre after heavy rainfall.

Structures: Seven university schools are situated around the site and two structures built to house university work and Henry Price accommodation. These structures may contain up to ~5500 students on an average week, indicating that they are likely to be the primary stakeholder of the site.

Major Structures

There are 2 Major Structures:

- 4) Cemetery Lodge- Greek Revival style building made from Ashlar stone blocks, Gritstone, grey slate roofing, wrought iron gates and glass panels. This structure was designed by architect John Clark and built in 1835 to served as an entrance to the cemetery and housed cemetery staff who managed the grounds, records and access to burial sites
- 5) Chapel- Greek Revival style building made from the same materials as the Cemetery Lodge. This structure was designed by architect John Clark and built in 1835 to serve as a place to hold funeral services
